

How to Install Raspberry Pi OS

Saturday, February 08, 2025 2:03 PM

Materials:

- SD card (must have enough space for the OS; ie, 64-bit Raspberry Pi OS is 1.2 gigabytes)
- SD card adapter
- Laptop/other device

- 1). Go to <https://www.raspberrypi.com/software/> and install the Raspberry Pi Imager for the appropriate OS.
- 2). Use an adapter to plug the SD card into your computer.
- 3). Open the Raspberry Pi Imager. It should look something like this:

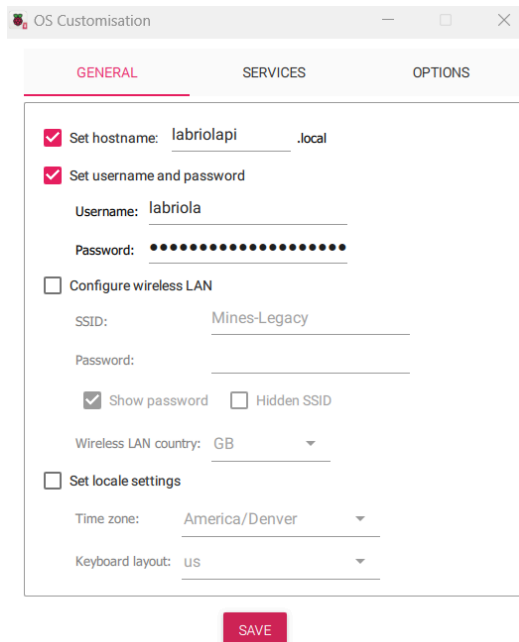

- 4). Select the Raspberry Pi device. In this case, the ones in the SparkFun sets are Raspberry Pi 5s.
- 5). Select an operating system. NOTE: this is the OS to use on the Pi, NOT what your computer runs. Raspberry Pi OS (64-bit) is what's recommended, but we could also use a Linux distro. There is an Ubuntu distro available under "other general-purpose OS."
- 6). Select the SD card as your storage. NOTE: the next steps will overwrite anything on the SD card, so make sure it's empty.
- 7). The imager will ask if you want to apply custom settings. Select "Edit Settings."
- 8). Set up a hostname, username, and password for the Pi. You can also configure the wifi if it's needed.

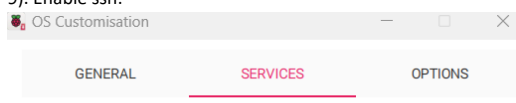

REMEMBER YOU PASSWORD, YOU WILL NEED THIS TO SSH INTO YOUR PI!!!

NOTE: see "Raspberry Pi setup" for more on connecting to the Mines internet.

Ex:

- 9). Enable ssh:

☒ Enable SSH

☒ Use password authentication

☐ Allow public-key authentication only

Set authorized_keys for 'labriola':

RUN SSH-KEYGEN

SAVE

- 10). Click "Save."
- 11). Click "Yes" on the menu to save customized settings.
- 12). Click "Next."
- 13). It will warn you that you are about the reformat the SD card. Click "Yes."
- 14). The imager will now install the Raspberry Pi OS image onto the SD card. It may take a few minutes to do so.
